

The Total Stadium Control System (TSC) is a wireless, centralised control solution that streamlines the operation of indoor sports facilities. Using a touchscreen or handheld device, operators can control multiple systems simultaneously, reducing set-up and strike times compared to traditional key switches. This improves efficiency, minimises labour costs and downtime, and increases court availability for revenue-generating activities.

With password-protected access and a scalable design, the TSC can easily expand as additional equipment is added to the facility.
